Municipal Vulnerability Preparedness Plan 2.0

MARION, MASSACHUSETTS

Legend (#) corresponding Priority Resilience Action

- Town Hall
- Fire Department
- Police Department
- Department of Public Works
- Sippican Elementary School (3)
- Council on Aging
- Culverts
- Pump Stations (2)
- FEMA Very High Risk Coastal areas
- Forested Streets susceptible to trees blown down (4)

CLIMATE HAZARDS identified in the 2018 plan

Sea Level Rise and Coastal Flooding

Coastal flooding threatens downtown buildings, low-lying wastewater pump stations, and shoreline ecosystems.

On the map: FEMA Very High Risk Coastal Areas, pump stations, municipal buildings.

Extreme Precipitation

Heavy rainfall overwhelms culverts and stormwater infrastructure increasing flooding and wastewater-system risks.

On the map: culverts, pump stations.

Wind

Marion has several roads that are susceptible to trees blown down during high wind. Fallen trees block roads and cause damage to infrastructure.

On the map: forested streets include Point Road, Converse Road, and Dexter Road.

Extreme Temperatures

Extreme high and low temperatures threaten vulnerable populations, especially those without access to shelter, heat, or air conditioning.

On the map: the Sippican School is a shelter during extreme weather events.

PRIORITY RESILIENCE ACTIONS identified in the 2018 plan

1 Enhance Communication systems

- Purchase generator to install at DPW Repeater site.
- Hire an Information Technology support person either full or part time to manage more robust tech/ communication systems.
- Invest in an alert system for residents that can call and/or text residents of any town-wide happening, including road closures, detours, evacuation routes, etc.
- Purchase and install battery backup at Point Road Repeater Site.

2 Elevate Pump Stations

- Assess existing pump stations for elevation and create a plan to elevate to make public water system more resilient to hazards like sea level rise and flooding.

3 Ensure Shelter Preparedness and Evacuation Planning

- Create plan that identifies where and when to evacuate and where and when to shelter.
- Work with regional partners to create sheltering plan that addresses capacity and needs currently and into the future.
- Ensure shelters have generators for heating/cooling and charging electronics.
- Create communication and evacuation plan with private vulnerable group homes to understand evacuation and/or sheltering measures.

4 Create Forest Management Plan

- Directly ties into evacuation and shelter access related to roads that experience tree blowdown.

Which priorities are still relevant for the MVP 2.0 Plan?
